

# Chapter 4: Hypothesis Testing

## Unit 2 Testing the Difference Between Two Means

Prepared by:

**Kamarul Ariffin Mansor**

Department of Mathematical Sciences  
UiTM Kedah Branch Campus

## Outline

1. Testing the Difference Between Two Means: Using the  $z$  Test
2. Testing the Difference Between Two Means of Independent Samples: Using the  $t$  Test
3. Testing the Difference Between Two Means: Dependent Samples

## Learning Objectives

1. Test the difference between sample means, using the  $z$ -test.
2. Test the difference between two means for independent samples, using the  $t$  test.
3. Test the difference between two means for dependent samples.

### Assumptions:

1. Both samples are random samples.
2. The samples must be independent of each other. That is, there can be no relationship between the subjects in each sample.
3. The standard deviations of both populations must be known; and if the sample sizes are less than 30, the populations must be normally or approximately normally distributed.

Large Sample Case

Formula for the  $z$  test for comparing two means from independent populations

$$z = \frac{(\bar{X}_1 - \bar{X}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}}$$

(a) Difference is not significant

Do not reject  $H_0: \mu_1 = \mu_2$  since  $\bar{X}_1 - \bar{X}_2$  is not significant.

(b) Difference is significant

Reject  $H_0: \mu_1 = \mu_2$  since  $\bar{X}_1 - \bar{X}_2$  is significant.

A study using two random **samples of 35 people** each found that the average amount of time those in the age group of 26–35 years spent per week on leisure activities was 39.6 hours, and those in the age group of 46–55 years spent 35.4 hours. Assume that the population standard deviation for those in the first age group found by previous studies is 6.3 hours, and the population standard deviation of those in the second group found by previous studies was 5.8 hours.

At  $\alpha = 0.05$ , can it be concluded that there is a significant difference in the average times each group spends on leisure activities?

**Step 1** State the hypotheses and identify the claim.

$$H_0: \mu_1 = \mu_2 \quad \text{and} \quad H_1: \mu_1 \neq \mu_2 \text{ (claim)}$$

- Since we have two groups...so we have  $\mu_1$  and  $\mu_2$ .
- Above is how we stated the hypothesis ( two-tailed testing)

**Step 2** Find the critical values. Since  $\alpha = 0.05$ , the critical values are  $+1.96$  and  $-1.96$ .

To find the critical value..same as for one sample. In this problem  $\alpha$  need to divide by 2 ( two tailed). Using table 4, since  $n > 30$ .

**Step 3** Compute the test value.

$$z = \frac{(\bar{X}_1 - \bar{X}_2) - (\mu_1 - \mu_2)}{\sqrt{\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}}} = \frac{(39.6 - 35.4) - 0}{\sqrt{\frac{6.3^2}{35} + \frac{5.8^2}{35}}} = \frac{4.2}{1.447} = 2.90$$

**Step 4:** Make the decision.

Reject the null hypothesis at  $\alpha = 0.05$ , since  $Z = 2.90 > CV = 1.96$

**Step 5:** Summarize the results.

There is enough evidence to support the claim that the means are not equal.

That is, the average of the times spent on leisure activities is different for the groups.

Formula for the  $t$  test for comparing two means from independent populations with unequal variances

$$t = \frac{(\bar{X}_1 - \bar{X}_2) - (\mu_1 - \mu_2)}{s_p \sqrt{\frac{1}{n_1} + \frac{1}{n_2}}} \quad ; \quad df = n_1 + n_2 - 2$$
$$s_p = \sqrt{\frac{(n_1 - 1)s_1^2 + (n_2 - 1)s_2^2}{n_1 + n_2 - 2}}$$

Assumptions

1. The samples are random samples.
2. The sample data are independent of one another.
3. When the sample sizes are less than 30, the populations must be normally or approximately normally distributed.

A researcher wishes to see if the average weights of newborn male infants are different from the average weights of newborn female infants.

She selects a random sample of 10 male infants and finds the mean weight is 7 pounds 11 ounces and the standard deviation of the sample is 8 ounces.

She selects a random sample of 8 female infants and finds that the mean weight is 7 pounds 4 ounces, and the standard deviation of the sample is 5 ounces.

Can it be concluded at  $\alpha = 0.05$  that the mean weight of the males is different from the mean weight of the females?

Assume that the variables are normally distributed.

**Step 1: State the hypotheses and identify the claim.**

$$H_0: \mu_1 = \mu_2 \text{ and } H_1: \mu_1 \neq \mu_2 \text{ (claim)}$$
$$7 \text{ lb } 11 \text{ oz} = 7 \times 16 + 11 = 123 \text{ oz}$$
$$7 \text{ lb } 4 \text{ oz} = 7 \times 16 + 4 = 116 \text{ oz}$$

**Step 2: Find the critical values.**

Since the test is two-tailed and  $\alpha = 0.05$ , the critical values are +2.120 and -2.120.

**Step 3: Find the Test Value.**

Test value (t-statistic) = .....

**Step 4: Make the decision.**

.....

**Step 5: Summarize the results.**

There is not enough evidence to support the claim that the mean of the weights of the male infants is different from the mean of the weights of the female infants.

**Hypothesis testing :****Decision rule when using a P-value**

If  $P\text{-value} \leq \alpha$  reject the null hypothesis

If  $P\text{-value} > \alpha$  do not reject the null hypothesis

| Right-tailed         |                          | Left-tailed          |                          |
|----------------------|--------------------------|----------------------|--------------------------|
| $H_0: \mu_1 = \mu_2$ | $H_0: \mu_1 - \mu_2 = 0$ | $H_0: \mu_1 = \mu_2$ | $H_0: \mu_1 - \mu_2 = 0$ |
| $H_1: \mu_1 > \mu_2$ | $H_1: \mu_1 - \mu_2 > 0$ | $H_1: \mu_1 < \mu_2$ | $H_1: \mu_1 - \mu_2 < 0$ |

**Exercise chapter 9 section 9.2 question no 5. (from textbook)**

**5. Carbohydrates in Candies** The number of grams of carbohydrates contained in 1-ounce servings of randomly selected chocolate and nonchocolate candy is listed here. Is there sufficient evidence to conclude that the difference in the means is statistically significant? Use  $\alpha = 0.10$ .

|               |    |    |    |    |    |    |    |    |
|---------------|----|----|----|----|----|----|----|----|
| Chocolate:    | 29 | 25 | 17 | 36 | 41 | 25 | 32 | 29 |
|               | 38 | 34 | 24 | 27 | 29 |    |    |    |
| Nonchocolate: | 41 | 41 | 37 | 29 | 30 | 38 | 39 | 10 |
|               | 29 | 55 | 29 |    |    |    |    |    |

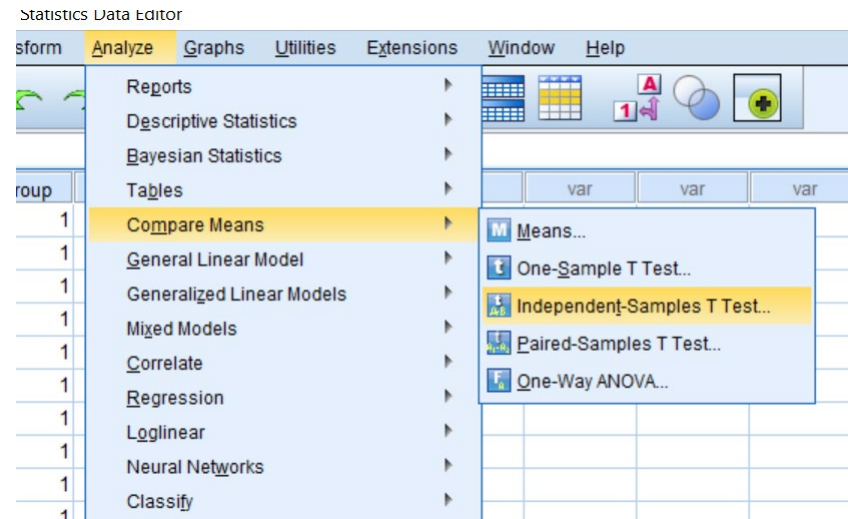

## Chapter 4: Hypothesis Testing – Difference between two means

### Test hypothesis using p-value method with SPSS

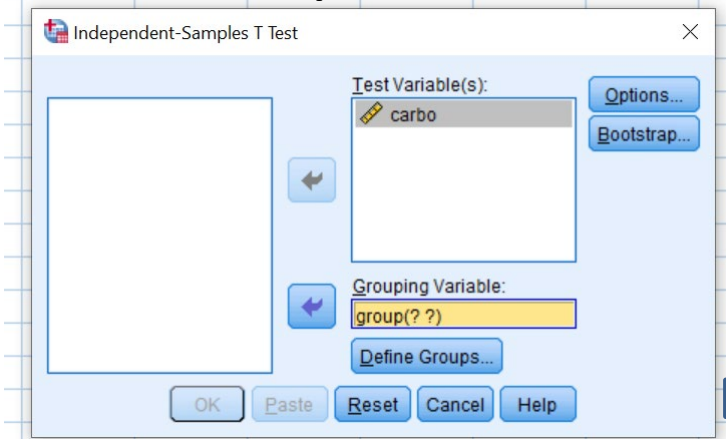

9\_9.2\_q5.sav [DataSet1] - IBM SPSS Statistics Data Editor

|    | carbo | group | var |
|----|-------|-------|-----|
| 1  | 29    | 1     |     |
| 2  | 25    | 1     |     |
| 3  | 17    | 1     |     |

|   | Equal variances not assumed |       |      |

| t-test for Equality of Means |        |        |                 |                 |                       |   |
|------------------------------|--------|--------|-----------------|-----------------|-----------------------|---|
|                              | t      | df     | Sig. (2-tailed) | Mean Difference | Std. Error Difference | 90% Confidence Interval of the Difference |
|                              |        |        |                 |                 |                       | Lower Upper                               |
| carbo                        | -1.274 | 22     | .216            | -4.671          | 3.666                 | -10.966 1.623                             |
|                              | -1.220 | 15.463 | .241            | -4.671          | 3.828                 | -11.369 2.026                             |

Is there sufficient evidence to conclude that the difference in the means is statistically significant?  
Use  $\alpha = 0.10$

### SOLUTION :

- Since we have two groups, so we have  $\mu_1$  = mean of carbohydrates for chocolate candy and  $\mu_2$  = mean of carbohydrates for non chocolate candy.
- Situation is two-tailed hypothesis testing
- Now refer to table independent sample test, see column Levenes' Test For Equality of Variance . There is two column, first column F and second column Sig. See Sig value is 0.189, this is a p-value. We write down as:  $p\text{-value} = 0.189$

#### ① Preliminary step

Here you can find the mean sample and standard deviation for each group. The 'Std. Error Mean' column is simply,  $\frac{s}{\sqrt{n}}$

#### ② Step 1 : Check for Levenes' Test

Setup the hypothesis for Levenes' test

$H_0$ : Equal variance assumed

$H_1$  : Equal variance is not assumed

Since p-value = 0.189 > alpha = 0.10.

Fail to reject  $H_0$ .

Conclusion : Equal variance assumed.

#### ③ Step 2 :State the hypotheses

$H_0: \mu_1 = \mu_2$

$H_1: \mu_1 \neq \mu_2$

#### ④ Step 4: Test hypothesis and make decision

Now refer to row equal variance assumed, there is another sig value. This is a second p-value. Now we are going to compare this p-value = 0.216 with alpha = 0.10. Since p-value = 0.216 >  $\alpha$  = 0.10, we failed to reject  $H_0$ .

**Conclusion :**

No sufficient evidence to conclude that there is different carbohydrates in chocolate candy and in non-chocolate candy.

## Test your SPSS skills

### Exercise (from textbook)

### Chapter 9, Section 9.2 Question No 6

6. **Weights of Vacuum Cleaners** Upright vacuum cleaners have either a hard body type or a soft body type. Shown are the weights in pounds of a random sample of each type. At  $\alpha = 0.05$ , can it be concluded that the means of the weights are different?

| Hard body types |    |    |    | Soft body types |    |    |    |
|-----------------|----|----|----|-----------------|----|----|----|
| 21              | 17 | 17 | 20 | 24              | 13 | 11 | 13 |
| 16              | 17 | 15 | 20 | 12              | 15 |    |    |
| 23              | 16 | 17 | 17 |                 |    |    |    |
| 13              | 15 | 16 | 18 |                 |    |    |    |
| 18              |    |    |    |                 |    |    |    |

**Check your output:**

At  $\alpha = 0.05$ , can it be concluded that the means of the weights are different?

**Group Statistics**

|                           |  | Body type      | N  | Mean  | Std. Deviation | Std. Error Mean |
|---------------------------|--|----------------|----|-------|----------------|-----------------|
| Weights of Vacuum Cleaner |  | Hard body type | 17 | 17.41 | 2.451          | .594            |
|                           |  | Soft body type | 6  | 14.67 | 4.761          | 1.944           |

**Independent Samples Test**

|                           |                             | Levene's Test for Equality of Variances |      | t-test for Equality of Means |       |                 |                 |                       |  | 95% Confidence Interval of the Difference |       |
